

Flood risk assessment - new data, methods and international cases

Jeroen Aerts

Professor, Head of Department of “Water and Climate Risk” at the Institute of Environmental Studies, Vrije Universiteit Amsterdam

“After an overview of the newest global data for flood risk assessment, such as storm surge levels and data on coastal infrastructure, we will zoom in on how coastal flood risk can be simulated now and in a future with climate change, and explain the adaptation pathways approach that supports decision makers to select measures under uncertainty. We use international cases (Los Angeles, Rotterdam, etc.) to provide inspiration how challenges can be solved with different solutions (levees, nature based solutions and insurance).”

**INVITATION TO INSPIRATION WEBINAR
MONDAY 30 NOVEMBER 2020 AT 15.00-16.15**

It is with great pleasure that we invite to the third webinar in a series which focuses on cities and rising sea levels. From different perspectives and based on Danish as well as international research and experiences the webinars will address challenges and solutions. It is free to join.

Registration: No later than 27 November 2020 to Kamilla Møller email: kahm@ign.ku.dk
Language: English. Platform: Zoom. Link will be sent by email before the webinar.

Jeroen is an internationally leading expert in water and climate risk management with 20 key publications in Nature, Science and PNAS and amongst the 1% highly cited researchers globally. Read more here:
